The importance of the hematological system in preclinical safety evaluation is widely recognized by the routine inclusion of hematological tests in toxicity studies. There is good concordance between the directly mediated effects of drugs on the hemopoietic system in humans and laboratory animals, with a modest degree of over- and under-prediction.

This book describes histopathological assessment of preclinical toxicology studies that are conducted to assess the safety of novel drugs. It discusses the implications of drug-induced changes that may be relevant to the critical early stages of the development of new therapeutic agents, notably prior to their first administration to humans and during early clinical trials.

This work covers effectively all aspects of drug-induced pathology that may be encountered within preclinical toxicity studies. It fills a gap in the pathology literature relating to the preclinical safety assessment of new medicines. It systematically describes, in one volume, both spontaneous and drug induced pathology on an organ by organ basis.
